

COMP 7005

Assignment 2

Design

Andy Tran
A01266629
October 2nd, 2024

Purpose	4
Data Types	4
Arguments	4
Settings	4
Context	4
Functions	5
Pseudocode	5
count_alphabetic_chars	6
Parameters	6
Return	6
Pseudo Code	6
get_local_ip	7
Parameters	7
Return	7
Pseudo Code	7
create_server_socket	8
Parameters	8
Return	8
Pseudo Code	8
accept_client_connection	9
Parameters	9
Return	9
Pseudo Code	9
receive_file_from_client	10
Parameters	10
Return	10
Pseudo Code	10
send_response_to_client	11
Parameters	11
Return	11
Pseudo Code	11
send_response_to_client(client_socket, response):	11
send the response to the client using sendall()	11
handle_client	12
Parameters	12
Return	12
Pseudo Code	12
start_server	13
Parameters	13

Return	13
Pseudo Code	13
send_file_content	14
Parameters	14
Return	14
Pseudo Code	14
receive_response	15
Parameters	15
Return	15
Pseudo Code	15
start_client	16
Parameters	16
Return	16
Pseudo Code	16
validate_port	17
Parameters	17
Return	17
Pseudo Code	17

Purpose

- This program has a server-side and client-side code. They accept 1 and 3 arguments respectively, from the command line:
 - Server:
 - <port>: The port number on which the server will listen for incoming TCP connections.
 - Client:
 - <server_ip>: The IP address of the server.
 - <port>: The port number to connect to on the server.
 - <file_path>: The path to the file whose content will be sent to the server.
- The client will send the file content to the server over a TCP socket. The server will count the number of alphabetic characters in the file and return the count to the client.

Data Types

Arguments

Purpose: To hold the unparsed command-line argument information

Field	Type	Description
file_path	string	The path to the file whose content will be sent to the server.
server_ip	string	The IP address of the server to connect to.
port	int	The port number for the TCP connection.

Settings

Purpose: To hold the settings the program needs to run.

Field	Type	Description
buffer_size	int	The buffer size used for sending/receiving data. Default is 4096 bytes.

Context

Purpose: To hold the arguments, settings, and exit information

Field	Type	Description

Functions

Function	Description
count_alphabetuc_chars	Counts the alphabetic characters in the file content.
get_local_ip	Retrieves the local IP address of server
create_server_socket	Creates and binds the server TCP socket to the specified port.
accept_client_connection	Accepts the client's TCP connection.
receive_file_from_client	Receives the file content from client
send_response_to_client	Sends the character count back to the client
handle_client	Processes the client's request.
start_server	Runs the server handles client requests and cleans.
send_file_content	Sends the file content to the server
receive_response	Receives and displays the server response
start_client	Starts the client sends file content and receive server response
validate_port	Validates the port before being used. Ensures within the range.

Pseudocode

count_alphabetic_chars

Parameters

Parameter	Type	Description
file_data	bytes	The file content received from client.

Return

Value	Reason
letter_ocunt	The number of alphabetic characters in the file content

Pseudo Code

```
count_alphabetic_chars(file_data):  
    return the count of alphabetic characters in the file_data
```

get_local_ip

Parameters

Parameter	Type	Description

Return

Value	Reason
local_ip	The server local IP address

Pseudo Code

```
get_local_ip():
```

```
    create a socket and connect to an external IP to get local IP  
    address
```

```
    return the local IP address
```

create_server_socket

Parameters

Parameter	Type	Description
port	int	The port number the server will listen on.

Return

Value	Reason
server_socket	The active TCP server socket that is bound to the port.

Pseudo Code

```
create_server_socket(port):
```

```
    create a TCP socket using socket.socket()
```

```
    set the socket options (reuse address)
```

```
    bind the server socket to the specified port using bind()
```

```
    start listening for incoming connections with listen()
```

```
    return the server_socket
```

accept_client_connection

Parameters

Parameter	Type	Description
server_socket	socket.socket	The server socket that listens for incoming client connections.

Return

Value	Reason
client_socket	This is the client side socket that can be used to communicate.

Pseudo Code

```
accept_client_connection(server_socket):
```

```
    Accept an incoming client connection using accept()
```

```
    Return the client_socket
```

receive_file_from_client

Parameters

Parameter	Type	Description
client_socket	Socket.socket	The socket connected to the client for receiving and sending data.

Return

Value	Reason
file_data	The accumulated file data received from the client

Pseudo Code

```
receive_file_from_client(client_socket):  
  
    initialize file_data as an empty byte string  
  
    while True:  
  
        receive a chunk of data from the client using recv()  
  
        if no more data is received:  
  
            break out of loop  
  
        append the received data to file_data  
  
    return file_data
```

send_response_to_client

Parameters

Parameter	Type	Description
client_socket	Socket.socket	The socket connected to the client for receiving and sending data.
response	string	The response to send to the client

Return

Value	Reason
file_data	The accumulated file data received from the client

Pseudo Code

```
send_response_to_client(client_socket, response):  
    send the response to the client using sendall()
```

handle_client

Parameters

Parameter	Type	Description
client_socket	Socket.socket	The socket connected to the client for receiving and sending data.

Return

Value	Reason
none	none

Pseudo Code

```
handle_client(client_socket):
```

```
    receive the file content from the client using  
    receive_file_from_client()
```

```
    try to decode the received file content into text
```

```
    count the number of alphabetic characters in the file using  
    count_alphabetic_chars()
```

```
    send the character count back to the client using  
    send_response_to_client()
```

```
    close the client socket
```

.'

start_server

Parameters

Parameter	Type	Description
port	int	The port number the server listens on

Return

Value	Reason
none	

Pseudo Code

```
start_server(port):  
    create the server socket using create_server_socket(port)  
  
    while True:  
        accept a client connection using  
        accept_client_connection(server_socket)  
  
        handle the client request using handle_client(client_socket)  
  
        if KeyboardInterrupt exception occurs:  
            break  
  
    close the server socket using cleanup_server(server_socket)
```

send_file_content

Parameters

Parameter	Type	Description
client_socket	Socket.socket	The active client socket used to send data to the server
file_path	string	The file path string that the client wants to send

Return

Value	Reason
nothing	none.

Pseudo Code

```
send_file_content(client_socket, file_path):  
  
    verify file is txt  
  
    open the file in binary read mode  
  
    while there is data left to send:  
        send chunks of the file content to the server via  
client_socket  
  
    close the file after the content is sent  
  
    shutdown the client socket for writing using shutdown
```

receive_response

Parameters

Parameter	Type	Description
client_socket	Socket.socket	The active client socket used to send data to the server

Return

Value	Reason
nothing	none.

Pseudo Code

```
receive_response(client_socket):  
    receive the server's response via client_socket  
    decode the response  
    print the server's response
```

start_client

Parameters

Parameter	Type	Description
file_path	string	The path to the file whose content will be sent to server
server_ip	string	The IP address of the server to connect to
port	int	The port number for the TCP connection

Return

Value	Reason
nothing	none.

Pseudo Code

```
start_client(server_ip, port, file_path):  
  
    create a client socket using socket.socket()  
  
    connect the client_socket to the server_ip and port  
  
    send the file content to the server using  
    send_file_content(client_socket, file_path)  
  
    receive and print the server's response using  
    receive_response(client_socket)  
  
    close the client socket
```

validate_port

Parameters

Parameter	Type	Description
port	int	The port number for the TCP connection

Return

Value	Reason
nothing	none.

Pseudo Code

```
validate_port(port):
```

```
    check if port is valid in range of 1024 - 65535
    if not print "Not valid port number please enter valid one"
    exit
```
